Instruction Manual

AEA MORSEMATIC

MODEL MM-1

Congratulations on your decision to purchase the versatile AEA MorseMatic™. You will find it is truly a gem for CW operation.

The MorseMatic has four basic modes of operation. With the Mode Selector Switch, you may choose between a keyer, a memory keyer, a beacon and a Morse trainer. Control for each mode is then transferred to the keypad for full feature programming.

Once you have read the directions in full, you will be able to send any one of up to ten preprogrammed messages at the touch of a button. The memory includes a flexible automatic serial number generator. You will also have a fully programmable trainer with an incredible range of features for learning or teaching Morse code. You will be able to use the Beacon mode with programmable send and receive times — ideal for scatter, moonbounce and tropospheric scheduling. And last but not least, you will have a programmable keyer with selectable speed, tone, dot-dash ratios and automatic and semi-automatic (bug) capabilities.

There's a lot more and the possibilities are endless! Just look in the pages that follow and learn how to perform your own MorseMatic magic!

*MorseMatic is a trademark of Advanced Electronic Applications, Inc.

TOP PANEL DESCRIPTION

REAR PANEL DESCRIPTION

HOOK-UP INSTRUCTIONS

1. **Power.** To perform the Check-Out Procedures in the following section and familiarize yourself with the MM-1, it is first necessary to apply 12 volts to the power input jack on the Rear Panel of the MM-1. This may be easily accomplished by connecting the cord attached to the optional AC-1 or AC-2 wall adapter to the power socket on the Rear Panel of the MM-1.

If you do not have one of the optional power supply units, it is necessary to supply 12 volts DC (± 3 volts) to the MM-1 from any external 12 volt source (including batteries) capable of delivering at least 350 ma. (600 ma. for the MM-1 with ME-1). Use the mating power connector supplied for interfacing the MM-1 and the power source. BE SURE TO OBSERVE PROPER POLARITY. The center pin is positive.

The MM-1 may be used in an automobile by using the optional DC-1 power cord.

2. **Paddle.** Wire your external keyer paddle to a stereo phone plug (not supplied) using two conductor plus shield cable (available from any Radio Shack store). Connect the shield to paddle common and the other wires to the dot and dash contacts. By convention, for right-handed operators, the thumb should activate the dot contact and the index and middle fingers should operate the dash contact.

drawn

3. **Straight Key.** A straight key may be used for sending, but cannot be used for memory operations. Use a **three conductor stereo plug** with the key across the tip (dash) terminal and the sleeve (common) terminal. The MM-1 must be programmed for Semiautomatic mode. It is **not** possible to load memory with a straight key.

4. **Headphones.** The headphone jack will drive low, medium, or high impedance headphones. A standard $\frac{1}{4}$ inch two conductor headphone plug is necessary.

5. **Transmitter.** The MorseMatic will key virtually any modern amateur radio transmitter. There are two output jacks which are diode protected against inadvertent hook-up to the wrong keying polarity. The ground side of the RCA phone jack (keyer output) should be connected to the transmitter chassis ground on the key input jack. The center conductor of the MM-1 keyed output jack should be connected to the "hot" terminal of the transmitter key input jack. Use a shielded coaxial cable for best R.F. immunity. Use the + keyed output jack to key cathode keyed and most keyed transmitters. Use the - keyed output jack to key grid-block keyed and some transistor keyed transmitters. If you connect your transmitter key input to the wrong MM-1 keyed output, either the transmitter will not key, or it will be keyed continuously. To correct the situation, simply plug the output line into the other output jack. No damage should occur to either the transmitter or the MM-1 if you connect to the wrong keyed output jack!

The extra RCA phone auxiliary jacks are provided for such things as bringing out connections for external Memory Recall switches. (See Schematic diagram for example).

CHECK-OUT PROCEDURE

We recommend that you perform the following functions to quickly acquaint yourself with the MorseMatic and to ensure the unit is operating properly.

KEYER SEND MODE

1. Turn the power switch on. The three LED lights will each blink momentarily and extinguish.

2. On the keypad, press and release $\boxed{*}$, then hold your finger on $\boxed{1}$. The monitor tone will increase in frequency.

3. Press $\boxed{*}\boxed{*}$ and hold $\boxed{1}$. The monitor tone will decrease in frequency.

4. *you* Send a series of letters with the external paddle to "get a feel" for the perfect code the MM-1 produces. *palpa*

5. Press $\boxed{*}\boxed{2}\boxed{0}\boxed{\#}\boxed{5}$ and send more Morse characters. Note that the length of the dots has shortened by one half.

6. Press $\boxed{*}\boxed{*}\boxed{2}\boxed{4}\boxed{\#}\boxed{0}$ and send more Morse characters. Note that the length of the dashes has increased by four-thirds. *four*

7. Turn the power switch off and back on. The monitor tone will return to 500 Hz and the dot and dash ratios will return to perfect 1:1 and 3:1 respectively.

8. Press $\boxed{*}\boxed{6}\boxed{0}\boxed{2}$ and note that the speed has slowed to 2 wpm.

9. Press the dot paddle and very quickly (before the dot has finished sending) press the dash paddle and then let up quickly. After the dot has finished and a proper intracharacter space inserted, a dash will automatically be sent. **This is called Dash Memory.**

10. Similar to step 9, press the dash paddle quickly and then press the dot paddle momentarily. After the dash is finished and an intracharacter space is inserted (automatically), the Keyer will send a dot automatically. **This is called Dot Memory or automatic dot insertion.**

11. Press $\boxed{*}\boxed{3}$ and repeat step 10. Note that the Dot Memory is no longer present.

12. Press $\boxed{*}\boxed{4}$ and repeat step 9. Note that the Dash Memory is no longer present.

13. Press $\boxed{*}\boxed{*}\boxed{3}$ and then $\boxed{*}\boxed{*}\boxed{4}$. Note that both Dot and Dash Memories are re-enabled.

*permits
a morse dot*

14. Enter $\boxed{*}\boxed{6}$ and a two digit number corresponding to a sending speed you feel comfortable with. (If less than 10 wpm use 0 as the first digit.) Practice sending at that speed for about a minute. Because the MorseMatic has almost perfect dot and dash ratios and spacing, many operators feel the speed calibration is low. Actually the MM-1 probably has the best speed calibration on the market. It is calibrated using the FCC definition of "PARIS" being the standard word. (See Appendix B.) You might also note that many practice code tapes are actually faster than the advertised speed.

15. Press $\boxed{*}\boxed{5}$ and note that a tone will appear as long as you hold the dash paddle. This is called **Semiautomatic** or "**Bug**" mode. Press $\boxed{*}\boxed{*}\boxed{5}$ and the Keyer will return to fully automatic operation.

16. Press $\boxed{*}\boxed{*}\boxed{A}$ and very quickly release the $\boxed{A}$ button before the feedback tone stops. The MM-1 should then key continuously until you press any keypad button or touch either paddle. This is the **Automatic Tune** feature. The Tune feature operates only in the KEYSER/MEMORY SEND mode. (If you hold the $\boxed{A}$ button down, the MM-1 will not go into the Tune mode.)

change. **MEMORY LOAD MODE** *from* **Lecture: Send.**

1. All of the steps you went through in the KEYSER SEND mode could be repeated in MEMORY LOAD mode (except for the Automatic Tune. It is not necessary!)

2. Press $\boxed{1}\boxed{\#}$, $\boxed{2}\boxed{\#}$, $\boxed{3}\boxed{\#}$, $\boxed{4}\boxed{\#}$, $\boxed{5}\boxed{\#}$, $\boxed{6}\boxed{\#}$, $\boxed{7}\boxed{\#}$, $\boxed{8}\boxed{\#}$, $\boxed{9}\boxed{\#}$, $\boxed{0}\boxed{\#}$. This will clear all the memory locations. Verify this by turning the Mode Selector Switch to MEMORY SEND. Press any **numbered** button on the keypad. Nothing but a feedback tone should result, indicating the storage location is empty.

3. Return the Mode Switch to MEMORY LOAD. Press $\boxed{1}$ and send a short message, one word at a time, with the paddle. Upon completion of the message, press the $\boxed{\#}$ button which terminates message loading.

4. Return the Mode Switch to MEMORY LOAD and press $\boxed{1}$. Immediately upon release of $\boxed{1}$, the message you recorded will be sent. You may change speeds if you like and repeat the message again by pressing $\boxed{1}$.

5. Press $\boxed{1}$ and play back the message again. Between words in the message playback, press the dot paddle and hold momentarily. The message will halt without inserting an extra dot. Now you may send anything with the paddle. By pressing $\boxed{A}$, the message will resume sending from where you interrupted the message. This is a very useful feature for inserting a signal report, for example, in the middle of a message.

6. Return the Mode Switch to MEMORY LOAD and press $\boxed{2}$. With the paddle, key in the word "test" and press $\boxed{*}\boxed{9}\boxed{*}\boxed{9}\boxed{*}\boxed{9}$. Again, with the paddle, send "test" and then press $\boxed{*}\boxed{9}\boxed{*}\boxed{9}$. Now send "test" again with the paddle and press $\boxed{*}\boxed{9}$. Send "test" one more time, followed by the letter "K" with the paddle. Press $\boxed{\#}$ to terminate the message.

7. Return the Mode Switch to MEMORY SEND and press $\boxed{2}$ on the keypad. The message should play back a series of the word "test" with progressively shorter spaces between words.

8. Return the Mode Switch to MEMORY LOAD and press **[*][8][3]**. Now pause for a short while and send a message, one word at a time, with the paddle. Terminate the message by pressing **[#]**.

9. Return the Mode Switch to MEMORY SEND mode and press **[3]**. Immediately, upon release of **[3]**, the message will commence playing back with the exact same pauses as were present between words during the loading operation. This is called the REAL TIME SPACE Loading Mode. The other (AUTO WORD SPACE) loading mode will insert a maximum of one word space between characters unless you use the **[*][9]** or **[*][*][9]** instruction in the loading operation.

10. Return the Mode Switch to MEMORY LOAD and press **[*][*][8]**. Now press **[4]** and send "NR" with the paddle and press **[*][A]** which inserts the Serial Number Generator at this point in the message. Now send "K" with the paddle and terminate the message by pressing **[#]** on the keypad.

11. Return the Mode Switch to MEMORY SEND and press **[4]**. The Keyer should play back: NR 01 K. Press **[4]** again and the Keyer should play back NR 02 K. Now press **[*][0]** and then **[4]**. The Keyer should now play back NR 02 K again. (It repeated the same serial number.) Now press **[*][*][0][1][6][1][#]** and then press **[4]** again. Now the message should read NR 161 K.

12. Press **[4]** again and press the dot paddle between 162 and K to halt the message (right after the serial number).

13. Return the Mode Switch to MEMORY LOAD and press **[A]** (for Edit). Now, with the paddle, send DE K1 XX K. Press **[#]** to terminate the message loading.

14. Return the Mode Switch to MEMORY SEND and press **[4]**. The message should now read "NR 162 DE K1XX K". You have just edited your old message!

END OF CR

BEACON SEND MODE

1. Turn the Mode Switch to MEMORY LOAD and press **[1][#]**. (This erases the old message stored in location **[1]**.) Press **[1]** again and send a message into memory for about 15 seconds. Terminate the message by pressing **[#]**.

2. Return the Mode Switch to BEACON SEND. Press **[*][7][3][0][#]** and **[*][7][1][5][#]**. Now press **[1]** and hold your finger down until your sweep second hand on your watch comes up to the top of a minute. At that precise time, release your finger from the keypad button. The message should play back for 30 seconds (at about half the speed you loaded in). Note that the BEACON ACTIVE light should be continuously lit. There should be a 15 second pause and then the message will be automatically replayed. One second before the message is replayed, the BEACON TX light will come on and extinguish after the message is completed.

3. Halt the sequence by pressing the **[#]** button on the keypad or by pressing either paddle. Press **[*][7][1][5][#]** and **[*][*][7][3][0][#]**. Now press and release **[1]** and note that the speed should double and the pause between transmissions will be twice as long. NOTE: If you want a message to be transmitted at a given speed in the BEACON SEND mode, play the message

in MEMORY SEND mode at the desired speed and time the EXACT length of time it takes to play the message at that speed. Use this time to program the BEACON CYCLE ON time in the BEACON SEND mode.

MORSE TRAINER MODE

1. Turn the Mode Switch to MORSE TRAINER mode. Press **[*][6][0][5]** and **[*][*][6][2][0]** for a starting speed of 5 wpm and an ending speed of 20 wpm. Press **[*][7][0][#][5]** for a practice duration of 0.5 minutes.

2. Press **[A]** and the Keyer should start sending code at a 20 wpm character speed with space between characters such that the beginning word speed is only 5 wpm. The space between characters will shorten during the half minute until the spacing is proper for 20 wpm. The Trainer will now continue to send until you halt it by pressing the **[#]** button and hold it through at least one character. The Trainer may continue to send a couple of characters before final termination.

3. Press **[*][B]** and then **[A]**. The Trainer should repeat sending as in step 2 except that difficult characters will be included. Press and hold **[#]** to terminate.

4. Press **[*][*][B]** and **[*][C]**. Now press **[A]** and notice that the difficult characters have disappeared, but that the Trainer is sending random word lengths and not continuous five-letter code groups. Press and hold **[#]** to terminate.

5. Press **[*][*][C]** and **[*][D]**. Pressing **[A]** will now start slow code in five letter code groups. The slow characters will gradually speed up to 20 wpm in 0.5 minutes.

This concludes the check-out of your MorseMatic unit. If all these features operate properly, your MM-1 is in good operational condition. If not, please reread the instructions and if necessary, start over from the beginning. Providing you still have difficulties, contact the AEA Sales Department at 206-775-7373 for advice.

OPERATING INSTRUCTIONS

The MorseMatic™ has four fully programmable modes of operation: KEYER/MEMORY SEND, BEACON SEND, MEMORY LOAD and MORSE TRAINER. Each mode is enabled through the Mode Selector Switch.

Keyer Operation (Switch Mode Selector to KEYER/MEMORY SEND)

1. **Speed Set.** When you first turn on your MM-1, it is programmed to begin at 20 wpm, with a tone of 500 Hz. in the Automatic Keyer mode. To change the speed, push $\boxed{*}\boxed{6}$ and enter the new speed as two digits, eg. $\boxed{1}\boxed{5}$. If the new speed is less than 10 wpm, the first digit must be zero. The range of speed is from 02 to 99 wpm.

Example: To enter 40 wpm, press $\boxed{*}\boxed{6}\boxed{4}\boxed{0}$.

To enter 7 wpm, press $\boxed{*}\boxed{6}\boxed{0}\boxed{7}$.

2. **Sidetone Change.** To raise the sidetone, press $\boxed{*}\boxed{1}$ and hold the $\boxed{1}$ key until the desired tone is reached. The tone may be lowered by pressing $\boxed{*}$ twice and holding the $\boxed{1}$ key, i.e. $\boxed{*}\boxed{*}\boxed{1}$. (The keypad tone will be slightly lower than the CW monitor tone.)

3. **Automatic and Semiautomatic Operation.** On turn-on, the Keyer is set to Automatic Keyer operation. The Keyer may be operated in the Semiautomatic mode by pressing $\boxed{*}\boxed{5}$. The Keyer now behaves as a "bug". To return to full Automatic mode, press $\boxed{*}\boxed{*}\boxed{5}$.

4. **Dot-Dash Ratio.** "Perfect" Morse code is sent with the time for a dot equal to the time for a character space (a dot-space ratio of 1.0) and the time for a dash equal to 3 space times (a dash-space ratio of 3.0).

The dot-space ratio is adjustable from 0.5 to 1.5 in 0.1 increments and is set to 1.0 on turn-on. To adjust the dot-space ratio, press $\boxed{*}\boxed{2}$ and enter the dot ratio with the pound (#) sign as a decimal.

Example: To enter a dot ratio of 0.7, press $\boxed{*}\boxed{2}\boxed{0}\boxed{\#}\boxed{7}$ or $\boxed{*}\boxed{2}\boxed{*}\boxed{7}$.

To enter a ratio of 1.3, press $\boxed{*}\boxed{2}\boxed{1}\boxed{\#}\boxed{3}$.

If the dot-space ratio entered exceeds 1.5 or is less than 0.5, the ratio will be set to 1.0.

The dash space ratio is set to 3.0 on turn-on and is adjustable from 2.0 to 4.0 in 0.1 increments. To change the dash ratio, enter $\boxed{*}\boxed{*}\boxed{2}$ and the new dash ratio.

Example: Dash ratio of 3.5 is desired; press $\boxed{*}\boxed{*}\boxed{2}\boxed{3}\boxed{\#}\boxed{5}$.

If the dash-space ratio entered exceeds 4.0 or is less than 2.0, the ratio will be set to 3.0.

The code speed is automatically adjusted for other than "perfect" dot and dash ratios and is based on the word "PARIS".^①

^① See Appendix B, page 16.

Timing diagram for a 5-bit parallel keyer. The diagram shows three signals: Dash Contact, Dot Contact, and Keyer Output. The Dash Contact is high (Closed) during the first two intervals and low (Open) during the last three. The Dot Contact is high (Closed) during the first, third, and fifth intervals, and low (Open) during the second and fourth. The Keyer Output shows a sequence of pulses corresponding to the dot-dash-dot-dash-dot pattern. Labels indicate 'Operated during this interval' for the first and third intervals, and 'released during this interval' for the second and fourth intervals. A diagonal line at the bottom right indicates the sequence continues.

Less than one
space time, otherwise
another dash
will occur.

To disable the Dot Memory, press **[*] [3]**

To enable the Dot Memory, press **[*][*][3]**.

To disable the Dash Memory, press **[*] [4]**

To enable the Dash Memory, press *** * 4**.

7. Clearing Entries. If an error in programming occurs and the programming was not completed, it may be cleared by pressing **[#] [#]**. If the entry was completed, repeat with the correct programming.

8. Unacceptable Entries. Unacceptable entries will be ignored. For example, if a speed change is entered **[*] [6] [2] [A]**, the result will be no speed change.

***IMPORTANT NOTE:** When the MorseMatic first has 12V or battery keep-alive power applied, the memory locations must all be cleared by pressing each storage location number followed by **#** as follows: **0 # 1 # 2 # 3 # 4 # 5 # 6 # 7 # 8 # 9 #**. Remember: Memory will never be lost

as long as 12V is supplied (even though the top panel power switch is turned off) or keep-alive batteries are used when power is removed. Memory **will** be lost if 12V power is removed and **no** keep-alive batteries are used.

1. **Memory Locations.** The MorseMatic has ten separate memory locations (0 through 9) that may be loaded with any length message up to approximately 500 characters total. You will be able to load about 487 characters if the word "PARIS" is repeatedly loaded. If you load longer characters such as 5's, you cannot load as many. One memory location can store all 500 characters or they may be allocated as desired. For instance, one location can store 50 characters, another 300 and another 150, etc. An optional Memory Expansion for 2,000 characters is available.

Two memory loading options are available, the Real-Time Load and the Automatic Memory Load. In both load modes, memory loading does not begin until the first character is loaded (i.e., there will be no pause when starting the Memory Send).

2. **Automatic Memory Load.** In Automatic Memory Load, a pause in loading that lasts longer than two dot times records a character space. If the pause is longer than five dot times, a word space is recorded. In this mode you may make long pauses between words without using additional memory. The MorseMatic is set to Automatic Memory Load during turn-on.

3. **Real-Time Memory Load.** To select Real-Time Memory Load, press **[*][8]**. In the Real-Time Memory Load, all pauses in sending will be recorded as sent. To reselect Automatic Memory Load, press **[*][*][8]**.

4. **Message Entry.** To enter a message into the memory, press the number of the desired storage location, key in the message with the paddle and terminate the message with **[#]**.

Example: To store a message in memory **[5]**, press **[5]**.

Now enter the message with the key.

IMPORTANT: After the message is entered, press **[#]**.

5. **Maximum Loading Speed.** The maximum loading speed is normally 20 wpm. However, faster loading (up to 40 wpm.) is permissible if the memory is loaded in sequence (0, 1, 2, etc). This means that to load a given memory at 40 wpm (say memory 3), all higher memories (4, 5, 6, etc.) must be empty or contain relatively short messages. When the MorseMatic is first turned on, the memories contain random characters (garbage). These must be cleared prior to high-speed, sequential loading by performing the clearing operation, as in the important note above.

If the maximum loading speed is exceeded, loading errors will be present in the memory being loaded. Other memories will not be affected.

6. **Serial Number Use.** An automatically incremented serial number (01 to 9,999) may be inserted anywhere in any of the ten messages. It may also be inserted as many times as desired within a message. (The serial number automatically increases by one, only after a message is completed.)

To insert the Automatic Serial Number Generator during the loading of a message, press **[*][A]**.

On turn-on, the serial number is set to 01. In the Memory Load mode, a different starting serial number may be loaded by pressing **[*][0][X][X][X][X]** **[#]**. Do not change the number during message loading.

Examples: To start at serial number 57, press **[*][0][5][7][#]**.

To start at serial number 4234, press **[*][0][4][2][3][4][#]**.

The serial number may be reset to 01 by pressing **[*][*][0]**, in the Memory Load mode.

7. Pause in Automatic Load. An extra pause, or dead time, may be loaded in memory. A character space (equal to three dot times) may be inserted in a message by pressing **[*][*][9]**. A word space (equal to seven dot times) is loaded by pressing **[*][9]**.

8. Erasing. If continuous power is supplied by a 12V DC power source and/or back-up batteries, turning the MorseMatic power switch to OFF will not erase the memory. If the 12V power source is interrupted and no back-up batteries are used, the memory will be lost and on turn-on will fill with random characters (garbage). If a complete memory loss occurs, the reset instructions on page 9, under *IMPORTANT NOTE, must be followed before re-programming.

If individual messages are to be erased, simply press the message number **[N]** and **[#]**. The entire message in that location will be erased.

Example: To erase messages 3 and 7, press **[3][#]** and **[7][#]** or **[7][#]** and **[3][#]**.

If long messages are to be entered, unused or undesired messages should be erased.

9. Editing. If in MEMORY SEND (see MEMORY SEND section), a message is halted before it is completed, the remainder may be terminated or changed at that point. Switch to MEMORY LOAD. To change the remainder of the message, press **[A]**, enter the new part of the message normally, and finish with **[#]**. If the remainder of the original message was to be erased, press **[A][#]**.

10. Memory Full. The Memory Full warning light is illuminated when approximately 22 characters remain. When the sidetone changes, all memory is full and loading is automatically terminated. If further loading is desired to complete the current message, one of the other messages must be erased or shortened. (Use the edit mode for reducing a previous message and then continue the current message.) If further loading is repeatedly initiated before clearing space, all messages will be lost. It will then be necessary to clear and reset all storage locations according to the instructions in the IMPORTANT NOTE at the beginning of the section on Memory Keyer Programming, page 9. In addition, it will be necessary to momentarily disconnect the power plug (and back-up batteries if used).

11. Semiautomatic (Bug) Memory Load. Messages may be entered in the Semiautomatic (bug) mode. In the MEMORY SEND, they will be sent with the selected dot and dash ratio. Some paddles require a 1 mf capacitor across the dash contacts to prevent multiple dash loading due to contact bounce.

12. Battery Life. The two internal size C batteries (not supplied) are intended for short term memory retention only. The batteries are used only when 12V power is removed from the unit. In continuous use the batteries will only last about 10-24 hours. For longer life, see the CMOS Memory Option on the MorseMatic Accessories page of the Manual.

MEMORY KEYER OPERATION (Switch Mode Selector to KEYER/MEMORY SEND)

The messages stored in any of the ten memory locations may be sent at any speed between 2 and 99 wpm, regardless of their loading speed.

1. **Sending a Message.** To start a message, press the number of the desired message. The message will start when the button is **released**.

Example: To send message 6, press [6], release.

2. **Interrupting and Restarting a Message.** A message may be interrupted by either pressing the [#] button or tapping either of the key paddles. The MorseMatic then enters normal keyer operation. The message may either be restarted by pressing the message number or resumed from the point of interruption by pressing [A]. Once a message is finished, pressing [A] will start the next message in the series 0-9. (This does not return the Keyer to 0 from 9.)

3. **Editing.** See page 11, #9.

4. **Serial Number Change or Repeat.** One serial number may be entered in a message as many times as desired. Serial numbers automatically increase by one **only** after a message has been completed.

It is common in contests for a station to ask for a repeat of the serial number **only**. We recommend that you load one message location [N] with:

[N] "NR" (keyed in with paddle) [*][A] [*][A] "K" (keyed in with paddle) [#]. Now in MEMORY SEND mode press [*][0] and then [N] for the serial number alone to be repeated twice. This can also be used to verify your last serial number. Each time [*][0] is pressed, the serial number will be reduced by one.

In the KEYER/MEMORY SEND mode, a new serial number may be entered by pressing [*][*][0][X][X][X][X][X][#].

Example: To reset the serial number to 285, press [*][*][0][2][8][5][#].

Note that leading zeros are not necessary.

If a message with a serial number was sent and the contact was not completed, press [*][0] prior to making your next contact and the previously sent serial number will be reused for the new contact.

BEACON SEND OPERATION (Switch Mode Selector to BEACON SEND)

In certain areas of communications such as moonbounce, tropospheric and meteor scatter, it is desirable to transmit a message during a fixed time and then receive for another fixed time.

The MorseMatic does this by sending any of the ten memory messages in a selected time by adjusting the code speed.

1. **Beacon On and Off Times.** To set the Beacon Off time, first load a short message in any one of the memory locations; a single dot or dash is sufficient. Then, switch to Beacon operation and load the duration or Off time normally. (It is the **loading** operation that clears one of the internal registers. Just having something loaded in the memory is not sufficient.)

The range of Beacon On and Beacon Off times is from one second to 999 seconds in one second increments. The time entry must be terminated with the pound sign **#**.

Example: A message is to be sent lasting 15 seconds and then the receiver is to be activated for 45 seconds. Load the Beacon On time for 15 seconds by pressing ***[7][1][5][#]**. Load the Beacon Off time (receive time) for 45 seconds by pressing ***[*][7][4][5][#]**.

2. **Serial Numbers in Beacon Mode.** Serial numbers may be included in a Beacon message. However, because some numbers take longer to send than others, the "Beacon On" time may vary slightly from one number to the next.

3. **Initiating Beacon Mode.** To start the Beacon, press the digit that stores the desired message. The message is started when the button is released. The Beacon On Indicator Light will remain on while the Beacon is cycling.

4. **Interrupting Beacon Mode.** As in the MEMORY SEND mode, the Beacon may be interrupted by pressing the **#** button or touching either of the key paddles. After interruption, KEYSER mode is entered.

5. **Restarting or Resuming Beacon Mode.** As in the MEMORY SEND mode, the Beacon may be restarted by pressing the number of the desired message or the Beacon message may be resumed by pressing **A**.

6. **Transmitter Send-Receive Output.** An accessory output is available on the MorseMatic to operate a transmitter send-receive switch from one second before the Beacon starts sending until the Beacon message is completed. The first time the Beacon message is sent, the accessory output is not operated. This allows a test of the message speed before operating the transmitter. This accessory output may be connected to one of the auxiliary jacks. (See Schematic.) The Beacon Transmit Light will indicate when this output is activated. This feature allows manual transmitter switching, if desired. If this is used to key a relay, an inductive "kick" diode shunt must be used as shown below.

MORSE TRAINER OPERATION (Switch Mode Selector to MORSE TRAINER)

The MORSE TRAINER sends randomly selected Morse characters at an increasing speed for a programmable duration. The random characters are preprogrammed into one of the custom microcomputers using a pseudo random generator. Several modes of operation are possible.

1. **Trainer Starting Speed.** The starting speed is set to 05 wpm on turn-on in the Fast (Farnsworth) mode. In the Farnsworth mode, the starting speed is the word speed. To change the starting speed, press $\boxed{*}\boxed{6}$ and enter the two digit speed desired.

Example: For 07 wpm starting speed, press $\boxed{*}\boxed{6}\boxed{0}\boxed{7}$.

2. **Trainer Finishing Speed.** In the Farnsworth mode, the finishing speed is the character speed. The finishing speed is set to 15 wpm on turn-on. To change the finishing speed, press $\boxed{*}\boxed{*}\boxed{6}$ and your desired speed using 2 digits.

Example: For a finishing speed of 20 wpm: $\boxed{*}\boxed{*}\boxed{6}\boxed{2}\boxed{0}$.

The finishing speed must be at least one wpm higher than the starting speed.

3. **Trainer Speed Increase Duration.** To set the duration, first load a short message in any one of the memory locations; a single dot or dash is sufficient. Then, switch to the Trainer or Beacon operation and load the duration or Off time normally. (It is the **loading** operation that clears one of the internal registers. Just having something loaded in the memory is not sufficient.)

On turn-on, the Trainer practice duration is set for 10.0 minutes. The duration is entered in minutes and tenths of minutes with the $\boxed{\#}$ (pound) key used as a decimal. The digit following the decimal $\boxed{\#}$ concludes the entry and is necessary. The range is from 0.1 minute to 59.9 minutes.

Example: 15 min. 0 sec., press $\boxed{*}\boxed{7}\boxed{1}\boxed{5}\boxed{\#}\boxed{0}$.

At the end of the speed increase duration, the Trainer will continue to send at the finishing speed.

4. **Initiating Trainer Mode.** After the various Trainer options have been selected, the Trainer may be started by pressing any of the digits or the $\boxed{A}$ button. Each digit will send its own unique character sequence and your copy may be compared with the published Answer Booklet. If you find that you are memorizing the character sets, press the $\boxed{A}$ button for a random start. There will be a delay in the start of the Trainer after the button is released.

5. **Terminating Trainer Mode.** To stop the Trainer press and hold the $\boxed{\#}$ button until the Trainer quits sending. After the key is released, a few additional dots and dashes may follow. The key paddle may be used in place of the $\boxed{\#}$ button.

6. **Fast (Farnsworth) or Slow Code Mode.** Many people find learning code takes far less time if the characters are sent at speeds greater than 12 to 15 wpm, but with the spaces between characters much longer than normal for these speeds. This is referred to as the Fast Code or Farnsworth Method. In this mode, the characters are sent at the finishing speed, but the space between letters is adjusted to make the code speed equal to the starting speed. The extra space is gradually shortened until the code is sent at the finishing speed.

Slow Code sends code with the proper intracharacter spacing during the speed increase. Unless you can copy code at speeds greater than 12 wpm, we strongly recommend use of the Fast Code method.

During turn-on the Fast Code mode is selected. To select Slow Code, press ***D**. Fast Code is reselected by pressing *** * D**.

7. **Five-Character or Random Code Spacing.** On turn-on, the Trainer is set to transmit five-character code groups. If desired, random spacing may be selected by pressing *** C**.

8. **Common Characters or All Characters.** For the advanced code student, additional Uncommon Characters may be selected by pressing *** B**. Tables of both Common and Uncommon Characters are listed in Appendix A on page 16.

DISABLING CW SIDETONE OR KEYPAD FEEDBACK TONE

If diode D1 is removed, the CW sidetone is disabled. It is recommended that one end of the diode be clipped and the diode be pushed away from the lead.

Diode D2 supplies the keypad feedback tone and may be disabled in the same manner.

The Tune warning tone is supplied by both D1 and D2.

REMOTE MEMORY RECALL

Two memory locations, 0 and 1, may be remotely activated. Connect pads 31 and 32 to the auxiliary jacks as shown in the Schematic and install diodes D17, 18, 19, 20. Then, in addition to the keypad, momentary grounding of the respective auxiliary jack will start the MEMORY SEND feature in location 0 or 1.

APPENDIX A

Common Character Set

A	• —	O	— — —	2	• • — — —
B	— • • •	P	• — — •	3	• • • — —
C	— • — •	Q	— — • —	4	• • • • —

M	— —	0	— — — — —	Question mark	• • — — • •
N	— •	1	• — — — —	Double dash	— • • • —

Less Common Characters

Colon	— — — • •	Understood	• • • — <i>compais</i>
Semicolon	— • — — • <i>para regular</i>	Wait AS	• — • • <i>at 10:15</i>
Parenthesis	— • — — •	End of Work SK	• • • — — <i>End of Work</i>
Apostrophe	• — — — —	Break BK	— • • • — — <i>TRAVEL</i>
Exclamation point	— • — — —	End of Message AR	• — • — • +
Quote	• — • • • " " <i>quilted</i>		

Trainer Character Error

In the Less Common Characters set, the "parenthesis" has been accidentally coded incorrectly. It will be sent as — — — • — instead of — • — — • — , which makes the difficult character set even more difficult!

APPENDIX B

CODE SPEED

The International Morse Code speed is defined by the word "PARIS." It has 10 dots, 4 dashes, 9 intracharacter spaces, 4 intercharacter spaces, and one word space for a total equivalent of 50 code elements (dot or space time). To adjust code speed for various dot-space and dash-space ratios, the number of code elements in the word "PARIS" is used as a reference so that with any allowable dot-space and dash-space ratios, the code speed is correct for the reference word "PARIS."

An old rule of thumb says that to calculate code speed in words per minute, divide the total number of characters sent in one minute, by five. That can be quite misleading!!! This method does not accurately take into account the variable length of individual characters.

Quite often, when the speed of the MM-1 is compared against tape recordings of certain speeds, the MM-1 appears to be sending too slowly, but many tapes on the market are actually sent faster than the labeled speed! Suffice it to say that it is the opinion of AEA that the MM-1 has the most accurate speed calibration of **any** keyer, trainer, or code tape on the market.

ACCESSORIES FOR THE MORSEMATIC™ MM-1

ITEM	DESCRIPTION	COST
ME-1	2000 character plug-in Memory Expansion for MM-1.	\$59.95
AC-1	600 Ma. 12 Volt wall adapter for MM-1 with ME-1; also recommended for MM-1.	\$14.95
AC-2	350 Ma. 12 Volt wall adapter for all AEA Keyer and Trainer products except MM-1 with ME-1.	\$ 9.95
DC-1	Cigarette lighter cord for all AEA Keyers and Trainers except MT-1P.	\$ 5.95
CMOS 2114	Low current memory IC chip. Battery saving direct replacement for standard chip. One required for MM-1 or four required for MM-1 with ME-1.	\$14.95 ea.

Prices effective September 15, 1980. SUBJECT TO CHANGE WITHOUT NOTICE OR OBLIGATION.

TECHNICAL SPECIFICATIONS

Keyer and Trainer speed range:	2 to 99 wpm.
Memory:	4096 bits (approximately 500 Morse characters). Option to 16,384 bits.
Keying output:	grid block -300V. max., 30 ma. max. Cathode/transistor +300V. max., 200 ma. max.
Serial number range:	01 to 9,999.
Beacon send time range:	1 to 999 seconds.
Beacon receive time range:	1 to 999 seconds.
Trainer increasing speed duration:	0.1 to 59.9 minutes.
Dot memory On/Off:	program selectable.
Dash memory On/Off:	program selectable.
Dot-space ratio:	0.5 to 1.5
Dash-space ratio:	2.0 to 4.0
Semiautomatic (bug) mode:	program selectable.
Memory keep-alive:	holder provided for two size C batteries for up to 24 hours of memory retention. Batteries are automatically switched on only upon removal of external 12 volt source.
Trainer modes:	program common or all characters. Program slow or fast (Farnsworth) speed increase. Program random length or five letter word length.
Power required:	9-16 VDC at 350 Ma. (600 Ma. with Memory Expansion option.)
Weight:	1 lb. 12 oz.
Dimensions:	6" deep X 6" wide X 3½" high.
Options:	2000 character Memory Expansion board and switch. CMOS (battery saver) memory.

LIMITED WARRANTY

ADVANCED ELECTRONIC APPLICATIONS, INC. warrants to the original purchaser that this product shall be free from defects in material or workmanship for ninety days from the date of original purchase. In order to obtain warranty service: (1) Complete and mail the warranty registration card to Advanced Electronic Applications, Inc., and (2) Send written notification to the address below as soon as possible after discovering a possible defect:

Advanced Electronic Applications, Inc.
Attention: Service Department
Bldg. "O", 2006 - 196th S.W.
Lynnwood, Wa. 98036

The written notification must include a copy of the invoice. Include a description of the defective part or condition, with details of the electrical connections to associated equipment and list such equipment. Please enclose your name, phone number, and address. Shipping charges for any parts or units submitted for replacement under this warranty must be paid by the purchaser.

Correct maintenance, repair, and use are important to insure proper performance from this product. Carefully read the Instruction Manual. This warranty does not apply to any defect AEA determines is caused by (1) improper maintenance or repair, including the installation of parts or accessories that do not conform to the quality and specification of the original parts; (2) misuse, abuse, neglect, or improper installation; (3) accidental or intentional damage. The field installation of circuits or batteries according to the instructions in the manual will not nullify this warranty.

All implied warranties, if any, terminate ninety days from the date of original purchase. AEA is not responsible for damage to other equipment or property or any other consequential or incidental damage of any kind whether based on contract, negligence, or strict liability. Maximum liability shall not, in any case, exceed the purchase price of the unit.

The foregoing constitutes AEA's entire obligation with respect to this product. The original purchaser and any user or owner shall have no other remedy and no claim for incidental or consequential damages. Some states do not allow limitations on how long an implied warranty lasts or do not allow the exclusion of incidental or consequential damages, therefore, the above limitations and exclusions may not apply to you.

This warranty gives specific legal rights. You may also have other rights which vary from state to state.
