Remote control

Remote control (CI-V) information

CI-V connection

The transceiver's operating frequency, mode, VFO and memory selection, can be remotely controlled using a PC.

- Use a USB cable (A-B type, user supplied) to connect the IC-7610 and the PC (controller).
The required USB driver and driver installation guide can be downloaded from the Icom web site.

Go to "<http://www.icom.co.jp/world>," and then click "Support," "Firmware Updates / Software downloads" in sequence.

① The download procedure on the web page may be changed without notice.

Connection example

① Make the connection as short as possible. The transceiver may not be recognized by the controller, depending on the USB cable length.

Preparing

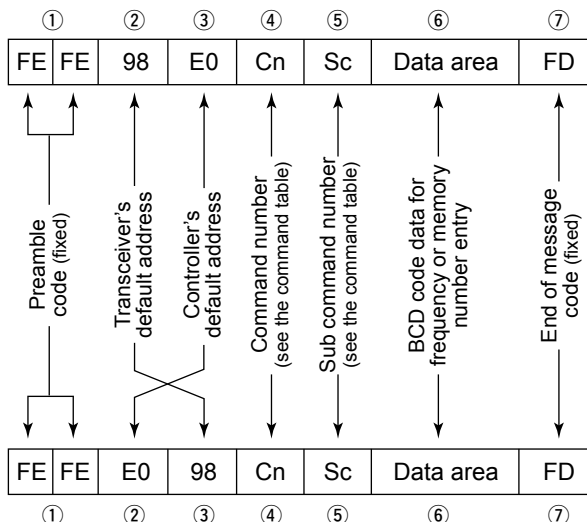

The Icom Communications Interface V (CI-V) is used for remote control.

To control the transceiver, first set its address, data communication speed, and transceive function. These settings are set in Set mode (Refer to the IC-7610 instruction manual).

About the data format

The CI-V system can be written using the following data formats. Data formats differ according to command numbers. A data area or sub command is added for some commands.

Controller to IC-7610

IC-7610 to controller

OK message to controller

NG message to controller

Remote control

NOTE: Operation to the some control dials overrides CI-V commands. If a control dial (such as the AF Volume dial that has a mark on it) is rotated after sending a CI-V command, the command will be overwritten by the operation.

*(Asterisk) Send/read data

*1 If the Antenna Type is set to "RX-I/O," command "01 (RX ANT ON)" is invalid and "00 (RX ANT OFF)" is always returned.

*2 If the Antenna Type is set to "RX-ANT," command "01 (ON)" is invalid and "00 (OFF)" is always returned.

*3 In the CW mode, if the [TRANSMIT] or an external TX switch is ON, or the Break-in function is ON, a message will be transmitted as CW code when you send it from your PC.

*4 When sending the power ON command (18 01), you need to repeatedly send "FE" before the standard format. The following is the approximate number of needed repetitions.

- 115200 bps: 150 "FE"s
- 57600 bps: 75 "FE"s
- 38400 bps: 50 "FE"s
- 19200 bps: 25 "FE"s
- 9600 bps: 13 "FE"s
- 4800 bps: 7 "FE"s

Example: When using 4800 bps

*5 Read only data

*6 To insert a counter, first clear the other channel's counter.

*7 When you use the [USB 1] port, you need to select "Unlink from [REMOTE]" in the "CI-V USB port" item, and you need to select "115200" in the "CI-V Baud Rate" item.

MENU » **SET > Connectors > CI-V**

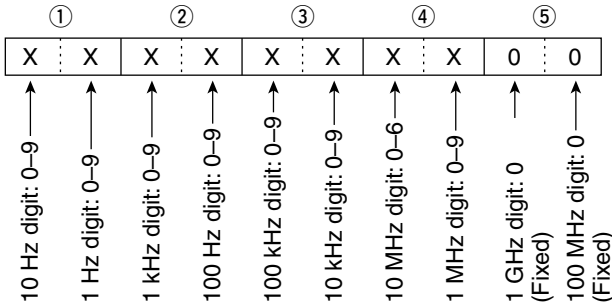

You can use the [LAN] port, regardless of those settings. You cannot use the [REMOTE] terminal, regardless of those settings.

◇ Command formats (Continued)

• Scope waveform data

Command: 27 00

Outputs the waveform data to the controller

- ① Main or Sub scope data
 - 00=Main scope, 01=Sub scope
- ② Order of division data (Current)
- ③ Division number (01 or 15)

When data is sent to the controller through the LAN port, all data is sent together. However, when the data is sent through the USB port, the data is divided by 15 and sent in sequential order.

	Division number	Data length	
LAN	01	704	
USB	15	1st data	15
		2nd or later data	53
		15th data	42

The 1st data sends only the wave information (① ~ ⑥) without the waveform data (⑦).
The 2nd or later data sends the minimum wave information (① ~ ③) with waveform data (⑦).

- ④ Center or Fixed mode data
 - 00 = Center mode scope,
 - 01 = Fixed mode scope
- ⑤ Waveform information

The waveform information is different between Center mode and fixed mode.

 - In the Center mode: Center frequency and span are sent
See page 10 for Frequency data, and the Scope span settings to the right.
 - In the Fixed mode: Lower edge and higher edge frequencies are sent
See page 15 for Scope Fixed edge frequency settings ③ ~ ⑫.
- ⑥ Out of range information
 - 00 = In range, 01 = Out of range
 - If the scope data is out of range, the waveform data (⑦) is omitted.

⑦ Waveform data

The transceiver outputs the drawn waveform data. The data range or data length of the waveform data is judged by the controller. (The data range is basically the same as the display size of the scope on the controller.)

Data range	0 ~ 200
Data length	689
