

## My F4TR has poor receive sensitivity in one channel, how do I fix this?

The frequency you have set may be receiving interference from your CPU clock. A harmonic of the crystal controlling your clock may be hitting the center of your frequency, causing self quieting in the radio because of the strength of that harmonic. This can be fixed by shifting the clock frequency slightly. You can do this by soldering a jumper and cutting a trace on the bottom of the main board.

Follow the modifications as shown below.
