ALINCO, INC.

SPECIFICATIONS

General		
Type	DJ-V5T	DJ-V5E
Receiving range	76-107.995MHz (Default: 88.1MHz) 144~147.995MHz 420~449.995MHz	87.5-107.995MHz (Default: 87.5MHz) 144~145.995MHz 430~439.995MHz
Transmitter range	144~147.995MHz 420~449.995MHz	144~145.995MHz 430~439.995MHz
Modulation	F2, F3 (FM), WFM (Reception)	
Frequency stability	±5ppm (-10°C~+60°C) (+14°F~+140°F)	
Ant. impedance	50Ω	
Supply voltage	Rating: DC13.8V Connection: DC4.0~15.0V	
Ground	Negative ground	
Current consumption (DC 13.8V. Average)	5W output: approx. 1.6A Rating output: approx. 220mA Squelch reception: approx. 70mA Battery save: Approx. 20mA	
Temperature range	-10°C~+60°C (+14°F~+140°F)	
Dimensions	W58×H97×D40.3mm (without projections. Battery case EDH-29 inclusive) (2.28"×3.81"×1.58")	
Weight	Approx. 335g (Ant. battery case. 4 AA batteries inclusive) (0.74lb. approx.)	

Transmitter		
Type	DJ-V5T	DJ-V5E
Power output	5W (1/0.5W)	
Modulation	Variable reactance	
Max. deviation	±5.0kHz	
Spurious emission	-60dB or less	
Mic. impedance	Approx. 2kΩ	

Receiver		
Type	DJ-V5T	DJ-V5E
System	Double-conversion superheterodyne	
First I.F.	FM: 39.15MHz	
Second I.F.	FM: 450kHz WFM: 13.35MHz	
Sensitivity (12dBSINAD)	76-107.995MHz WFM: 0dBμ 144~147.995MHz FM: -16dBμ 440~449.995MHz FM: -15dBμ	87.5-107.995MHz WFM: 0dBμ 144~145.995MHz FM: -16dBμ 430~439.995MHz FM: -15dBμ
Selectivity (except WFM)	-6dB/12kHz or over -60dB/30kHz or less	
Spurious response	60dB or over	
AF output	500mW or over (8Ω. 10% distortion factor. 13.8V)	
AF load impedance	8Ω	

CIRCUIT DESCRIPTION

1) Receiver System

1. Receiving System

Double Superheterodyne

1st IF: FM 39.15MHz, WFM (Wide FM) 13.35MHz

2nd IF: 450kHz

2. Front End Circuit

VHF

The signal from the antenna is passed through the duplexer FL301 and low-pass filter, and it is switched by D317 and amplified by RF amplifier Q312. Then passing through the band-pass filter, the signal is led to the mixer circuit IC306 via the band switch D314.

FM Radio

The signal from the antenna is passed through the duplexer FL301 and low-pass filter, and the signal is switched by D317 and amplified by RF amplifier Q318. Then passing through the band-pass filter, the signal is led to the mixer circuit IC306 via the band switch D314.

UHF

The signal from the antenna is passed through the duplexer FL301 and low-pass filter, and it is switched by D321 and amplified by RF amplifier Q321. Then passing through the band-pass filter FL303, the signal is led to the mixer circuit IC306 via the band switch D322.

3. Mixer circuit

The input signal is mixed with the signal from the first local oscillator at the first mixer IC306 to make the addition and subtraction. Then the signal is switched between FM and WFM by FM switch D319.

FM

FM receiving signal of 39.15MHz is selected by the crystal filter XF301. After eliminating the adjacent channel frequency signal, it is amplified at the first IF amplifier Q320.

WFM

WFM receiving signal of 39.15MHz is selected by band-filter eliminating the adjacent channel frequency signal.

The first local oscillator signal comes from VCO output, then is injected to the local input terminal of mixer IC306 via the buffer amplifier Q202. VHF band and FM radio employ the upper heterodyne system. UHF band employs the lower heterodyne system.

4. IF Circuit

The amplified signal at the first IF amplifier Q320 is led to the pin16 of IC307 for demodulation. The reference buffer output signal of 12.9MHz from IC302 is multiplied by 3 at Q322, and mixed with the input signal to pin1 of IC307 at the mixer circuit inside IC307. Then it is converted to the second IF signal of 450kHz. The converted second IF signal is output from pin3 of IC307, then fed to pin5 of IC307 after eliminating the adjacent channel frequency signal at the ceramic filter FL302. The second IF signal input to pin5 of IC307 is led to the limiter amplifier inside IC, and demodulated at the quadrature circuit, then the signal is output from pin10 of IC307 as an AF signal.

WFM

WFM signal is led to the pin16 of IC310 for demodulation. The reference buffer output signal of 12.9MHz from IC302 is multiplied by 2 at Q322, and mixed with the input signal to pin2 of IC310 at the mixer circuit inside IC310. Then it is converted to the second IF signal of 13.35MHz. The converted second IF signal is output from pin4 of IC310, then fed to pin7 of IC310 after eliminating the adjacent channel frequency signal at the ceramic filter FL304. The second IF signal input

DJ-V5/E/EA/T

to pin7 of IC310 is led to the limiter amplifier inside IC, and demodulated at the quadrature circuit, then the signal is output from pin9 of IC310 as an AF signal.

5. Squelch Circuit

FM

The AF signal comes from pin10 of IC307 is fed to pin11 of IC307. The input signal is led to noise filter amplifier inside of IC and the rectifier circuit, then output from pin13 of IC307.

The rectified signal is led to A/D port of microcomputer IC1. The microcomputer IC1 judges the signal to control the audio output ON/OFF switching.

WFM

The S meter signal is output from pin10 of IC310. This signal is led to the A/D port of microcomputer IC1. The microcomputer IC1 judges the signal to control the audio output ON/OFF switching.

6. Audio Circuit

FM/WFM

The audio output signal is switched at IC308 for FM receiving and at IC312 for WFM receiving. Output audio signal is led to the active band-pass filter Q329, then led to volume VR601 to adjust the audio level via audio switch Q330. Adjusted audio signal is led to the audio power amplifier pin2 of IC8, then output from pin6 to drive the speaker, etc.

7. VCO Circuit

VHF/FM Radio

The VCO of VHF/FM radio band is based on the Colpitts oscillator. The oscillating frequency is determined by D202, D204, L202 and L203, and oscillated at the transistor Q201. The oscillated signal is led to pin19 of PLL-IC302 via the buffer amplifier Q202 and Q304.

UHF

The VCO of UHF band is based on the Colpitts oscillator. The oscillating frequency is determined by D206, D208 and L204, and oscillated at the transistor Q203. The oscillated signal is led to pin2 of PLL-IC302 via the buffer amplifier Q202 and Q304.

8. PLL

PLL-IC302 is used to control the oscillating frequency of VCO. The IC302 is controlled by the serial control data from microcomputer IC1. The reference frequency of 12.9MHz is oscillated by the crystal oscillator X301 inside IC302.

VHF/FM Radio

The divide ratio is set by the control signal from IC1. The frequency that divides the input signal to pin19 of IC302 is compared with the frequency that can be gained by dividing the reference frequency of 12.9MHz inside IC302. When a phase error is occurred, the pulse signal is output from the charge pump pin13 of C302 and converted to the DC voltage by the active filter, then fed to the cathode of the varicap diode D202 and D204 to reduce the phase error. In result the stable oscillation can be obtained at the desired frequency.

UHF

The divide ratio is set by the control signal from IC1. The frequency that divides the input signal to pin2 of IC302 is compared with the frequency that can be gained by dividing the reference frequency of 12.9MHz inside IC302. When a phase error is occurred, the pulse signal is output from the charge pump pin8 of C302 and converted to the DC voltage by the active filter, then fed to the cathode of the varicap diode D206 and D208 to reduce the phase error. In result the stable oscillation can be obtained at the desired frequency.

2) Transmitter System

1. Microphone amplifier

The microphone amplifier IC314 consists of two operational amplifiers. The voice is converted into the electric signal through the microphone and led to IC314. The signal is output passing through the amplifier and pre-emphasis circuit.

VHF

Output signal from the microphone amplifier is adjusted the maximum deviation by VR302, then led to cathode of the varicap diode of D205 for modulation in VCO to vary the capacitance of the oscillating circuit. And the FM modulation is produced.

UHF

Output signal from the microphone amplifier is adjusted the maximum deviation by VR301, then led to cathode of the varicap diode of D207 for modulation in VCO to vary the capacitance of the oscillating circuit. And the FM modulation is produced.

2. Power Amplifier

The oscillated signal in VCO is led to buffer amplifier Q202, driver amplifier IC301 and Q308, then input to power amplifier Q306. The power amplified signal is attenuated the harmonic frequency enough passing through the low-pass filter and the duplexer, then fed to the antenna.

3) Terminal function of CPU

No.	Terminal	Signal	I/O	Description
1	AN7	BP1	I	Country
2	AN6	BP2	I	
3	AN5	TMP	I	Temp. input
4	AN4	MRC	I	Remote control
5	AN3	SMT	I	S-melter input
6	AN2	SQL	I	Squelch input
7	AN1	BATT	I	Battery input
8	AN0	TIN	I	Tone input
9	DA2	TOUT	O	Tone out
10	DA1	DOUT	O	DTMF out

4) LC73881M-TLM (XA0344)

DTMF Receiver

Block Diagram

Pin No.	Name	I/O	Descriptions
1	INPUT	I	Input coupling capacitor is required. This input is internally biased to VDD/2.
2	PD	I	When set to "H", the unit goes into the power down mode.
3	OSCO	O	The crystal oscillator or ceramic resonator should be connected between these terminals to compose the oscillator circuit.
4	OSCI	I	
5	VSS		Power supply terminal. Normally 0V.
6	SD	O	Decoded DTMF is output in 4 bit serial data following LSB.
7	ACK	I	ACK pin is used to shift the data to SD pin. 4 pulses are required to shift the DTMF letters consisting of 4 bits. The data is latched in the shift register before the rising edge of the first pulse is shifted.
8	STD	O	"H" indicates that DTMF signal exists. Compared with EST pin, this pin responds slowly to the input signal and doesn't sense the burst signal, etc.
9	EST	O	"H" indicates that DTMF signal exists. This pin is monitored, and 4 pulses are given to ACK to access the data after a proper time has elapsed.
10	VDD		Power supply terminal. Normally 2.7~5.0V.

6) MB88347LPFV-G-BND-EF (XA0599)

D/A converter for digital tuning

Block Diagram

Pin No.	Name	I/O	Descriptions
14	DI	I	Serial data input terminal. Input 12 bit serial data. (Do not leave it open.)
11	DO	O	The MSB bit data of 12 bit shift register is output at the falling edge of CLK.
13	CLK	I	Shift clock input terminal. The input signal of DI terminal is input to 12 bit shift register at the rising edge of clock shift. (Do not leave it open.)
12	LD	I	When LD terminal is "High", the value of shift register is loaded in decoder and D/A output register. (Do not leave it open. Fix to "Low" when no data is transited.)
15 2 3 4 5 6 7 10	AO ₁ AO ₂ AO ₃ AO ₄ AO ₅ AO ₆ AO ₇ AO ₈	O	8 bit D/A converter output terminal with operational amplifier.
9	V _{cc}	—	MCU interface, power supply terminal of operational amplifier.
16	GND	—	MCU interface, ground terminal of operational amplifier.
8	V _{DD}	—	Reference power supply (High) input terminal of D/A converter.
1	V _{SS}	—	Reference power supply (Low) input terminal of D/A converter.

7) NJM2070M T1 (XA0210)

Low Voltage Power Amplifier

Equivalent Circuit

$V_+ = 6V, T_a = 25 \pm 2^\circ C$

Parameter	Condition	Symbol	Min.	Typ.	Max.	Unit

18) μ PD3140GS-E1 (XA0312)

80~550MHz Dual PLL Synthesizer

Specifications

Operating frequency: 200~400MHz ($V_{in}=-12\sim 0\text{dBm}$, pin 2 and 19 input)

80~550MHz ($V_{in}=-8\sim 0\text{dBm}$, pin 2 and 19 input)

Consumption current: 2.7~4.1mA ($V_{cc}=1.8\text{V}$ while 1 channel is used)

4.3~6.6mA ($V_{cc}=1.8\text{V}$ while both channels are used)

0~10 μ A ($V_{cc}=1.8\text{V}$ in power save mode)

3.5~5.3mA ($V_{cc}=5\text{V}$ while 1 channel is used)

5.6~8.6mA ($V_{cc}=5\text{V}$ while both channels are used)

Operating voltage: 1.8~5.5V

ADJUSTMENT

1) Required Test Equipment

The following items are required to adjust radio parameters.	
1. Regulated Power Supply	Supply voltage: 5 to 14 VDC Current: 3A or more
2. Digital Multimeter	Voltage range: FS = Approx. 20V Current: 10A or more Input resistance: High impedance
3. Oscilloscope	Measurable frequency: Audio Frequency
4. Audio Dummy Load	Impedance: 8Ω Dissipation: 1W or more Jack: 3.5 mm ø
5. SSG	Output frequency: 500MHz or more Output level: -20dB/0.1μV to 120dB/1V Modulation: AM/FM
6. Spectrum Analyzer	Measuring range: Up to 2GHz or more
7. Power Meter	Measurable frequency: Up to 500MHz Impedance: 50Ω, unbalanced Measuring range: 0.1W to 10W
8. Audio Voltmeter	Measurable frequency: Up to 100kHz Sensitivity: 1mV to 10V
9. Audio Generator	Output frequency: 67Hz to 10kHz Output impedance: 600Ω, unbalanced
10. Distortion Meter/SINAD Meter	Measurable frequency: 1kHz Input level: Up to 40dB Distortion level: 1% to 100%
11. Frequency Counter	Measurable frequency: Up to 500MHz Measurable stability: Approx. ±0.1ppm
12. Linear Detector	Measurable frequency: Up to 500MHz Characteristics: Flat CN: 60 dB or more

Note:

- Standard modulation: 1kHz ±3.5kHz/DEV
- Reference sensitivity: 12 dB SINAD
- Specified audio output level: 200 mW at 8Ω
- Standard audio output level: 50 mW at 8Ω
- Use an RF cable (3D2W: 1m) for test equipment.
- Attach a fuse to the RF indicated by EMF.
- All SSG outputs are indicated by EMF.
- Supply voltage for the transceiver: 13.8 VDC

2) Entering and releasing the adjustment mode

DJ-V5 adjusts various items in the adjustment mode.

- 1) Press FUNC key more than 1 sec. (The key is locked.)
- 2) Press 4, 9, 0, 2, 1, and 7 with the keyboard.
- 3) "UFREQ" is indicated and the unit enters the adjustment mode.
- 4) Press 0 key to settle the adjustment when finished, then go back to the normal mode.

3) Adjustment

No.	Display	Items	Points
1	UFREQ	Reference frequency	TC301
2	UPO HI	UHF HIGH power	VR601
3	UPO L1	UHF LOW power	VR601
4	VPO HI	VHF HIGH power	VR601
5	VPO L1	VHF LOW power	VR601
6	VMOD	VHF modulation	VR302
7	UMOD	UHF modulation	VR301
8	VTUN L	VHF lower frequency sensitivity	VR601
9	VTUN M	VHF center frequency sensitivity	VR601
10	VTUN H	VHF upper frequency sensitivity	VR601
11	VSQ L 1	VHF squelch level 1 setting	FUNC KEY
12	VSQ L 5	VHF squelch level 5 setting	FUNC KEY
13	VSMT 1	VHF S-meter level 1 setting	FUNC KEY
14	VSMT 5	VHF S-meter level 5 setting	FUNC KEY
15	UTUN L	UHF lower frequency sensitivity	VR601
16	UTUN M	UHF center frequency sensitivity	VR601
17	UTUN H	UHF upper frequency sensitivity	VR601
18	USQ L 1	UHF squelch level 1 setting	FUNC KEY
19	USQ L 5	UHF squelch level 5 setting	FUNC KEY
20	USMT 1	UHF S-meter level 1 setting	FUNC KEY
21	USMT 5	UHF S-meter level 5 setting	FUNC KEY
22	WSMT 1	WFM S-meter level 1 setting	FUNC KEY
23	WSMT 5	WFM S-meter level 5 setting	FUNC KEY
24	WSMT 5	WFM AF output	L355

The display can be changed using UP/DOWN key.

NO.	Item	Condition	Measurement		Adjustment			Specifications
			Equipment	Terminal	Disp	Parts	Method	
15	Sensitivity (UHF)	f=379.13 RX	SSG Distortion Meter Oscilloscope Level Meter	ANT	UTUNL	V601	12dB μ SINAD max.	0dB μ (EMF) or below
16		f=419.13 RX			UTUNM			0dB μ (EMF) or below
17		f=459.13 RX			UTUNH			5dB μ (EMF) or below
18	Squelch (UHF)	f=435.13 RX (V5,V5E, V5EA) Output: -11dB μ Mod: OFF	SSG	ANT	USQL1	-	Press FUNC key to finish. A beep sounds.	
19		f=445.13 RX (V5T) Output: -5dB μ Mod: OFF			USQL5	-		
20	S meter (UHF)	f=435.13 RX (V5,V5E, V5EA) Output: 0dB μ Mod: OFF			USMT1	-		One segment of S meter is turned ON.
21		f=445.13 RX (V5T) Output: 20dB μ Mod: OFF			USMT5	-		5 segments of S meter are turned ON.
22	S meter (WFM)	f=88.13 RX Output: 0dB μ Mod: OFF			WSMT1	-		One segment of S meter is turned ON.
23		f=88.13 RX Output: 20dB μ Mod: OFF			WSMT5	-		5 segments of S meter are turned ON.
24	AF output (WFM)	f=88.13 RX Output: 20dB μ Mod: 1kHz Dev: 22.5kHz			WSMT5	L355 (Main unit A)	AF level max.	

After finishing all adjustments, press 0 key to escape from the adjustment mode.

(When escape from the adjustment mode on the way, press 0 key or proceed to the next item then escape from the mode.)
