

Lab599 CAT Protocol

Revision 3 / 2026-03

A control command is composed of an alphabetical command, various parameters, and the terminator that signals the end of the control command.

EXAMPLE: Command to set VFO A to 7 MHz

Commands can be classified as shown below:

For example, note the following in the case of the FA command (Frequency of VFO A):

- To set the frequency to 7 MHz, the following command is sent from the computer to the transceiver:
"FA00007000000;" **(Set command)**
- To read the frequency of VFO A, the following command is sent from the computer to the transceiver:
"FA;" **(Read command)**
- When the Read command above has been sent, the following command is returned to the computer:
"FA00007000000;" **(Answer command)**

Note:

- Do not use the control characters 00 to 1Fh since they are either ignored or cause a "?" answer.
- Program execution may be delayed while turning the **Tuning** control rapidly.
- Receive data is not processed if the frequency is entered from the keypad.

Parameters are used to specify information necessary to implement the desired command. The parameters to be used for each command are predetermined. The number of digits assigned to each parameter is also predetermined.

When configuring parameters, be careful not to make the following mistakes.

(correct parameter: "IS+1000")

- IS1000; Not enough parameters specified (No direction given for the IF shift)
- IS+100; Not enough digits (Only three frequency digits given)
- IS + + 1000; Unnecessary characters between parameters
- IS+10000; Too many digits (Five frequency digits given)

Note: If a particular parameter is not applicable to this transceiver, the parameter digits should be filled using any character except the ASCII control codes (00 to 1Fh) and the terminator (;).

■ Terminator

To signal the end of a command, it is necessary to use a semicolon (;). The digit where this special character must appear differs depending on the command used.

■ Error Messages

In addition to the Answer command, the transceiver can send the following error messages.

Error Message	Reason for Error
?;	- Command syntax was incorrect. - Command was not executed due to the current status of the transceiver (even though the command syntax was correct). Note: Occasionally this message may not appear due to microprocessor transients in the transceiver.
E;	A communication error occurred such as an overrun or framing error during a serial data transmission.
O;	Receive data was sent but processing was not completed.

PC CONTROL COMMAND TABLES

AC		Sets or reads the internal antenna tuner status.										Parameters: P1 0: Always 0 P2 0: AT OFF 1: AT ON P3 0: Stop Tuning (Set)/ Tuning is stopped (Answer) 1: Start Tuning (Set)/ Tuning is active (Answer) • TX500MP

W	Performs the VFO copy (A=B) function.										Parameters: No parameters are used with this command. TX500
Set	1	2	3	4	5	6	7	8	9	10	
	V	V	;								

VL	Reads the voltage power.										<u>Parameters:</u> P1 Voltage in V LAB599
Set	1	2	3	4	5	6	7	8	9	10	
Read	1	2	3	4	5	6	7	8	9	10	
	V	L	;								
Answer	1	2	3	4	5	6	7	8	9	10	
	V	L	P1	P1	P1	P1	;				

VOX	Sets and reads the VOX status.										<u>Parameters:</u> P1 0: VOX OFF 1: VOX ON
Set	1	2	3	4	5	6	7	8	9	10	
	V	X	P1	;							
Read	1	2	3	4	5	6	7	8	9	10	
	V	X	;								
Answer	1	2	3	4	5	6	7	8	9	10	
	V	X	P1	;							

XT	Sets and reads the XIT function status.										<u>Parameters:</u> P1 0: XIT OFF 1: XIT ON TX-500
Set	1	2	3	4	5	6	7	8	9	10	
	X	T	P1	;							
Read	1	2	3	4	5	6	7	8	9	10
